

Morena Solar Park

A Strategic M.P. & U.P. Complementarity Project

Project Overview & Strategy

A 2000 MW initiative to meet the renewable energy goals of Madhya Pradesh and Uttar Pradesh through an innovative, dual-tender approach.

The Complementarity Model

Uttar Pradesh (U.P.)

High demand period: **April - September**. UPPCL will procure power during these 6 months to meet its peak seasonal load.

Madhya Pradesh (M.P.)

High demand period: **October - March**. MPPMCL will procure power during these 6 months for its corresponding peak season.

Strategic Bifurcation

1000 MW Vanilla Solar

A standard, grid-connected solar PV project. This tender is structured on a unique complementarity basis between M.P. and U.P.

1000 MW Solar + Storage

A solar-plus-storage project with 4-hour BESS. This component is designed to manage evening peak load and ensure grid stability.

The 1000 MW "Vanilla" Tender

Focus: MP-UP Complementarity

This component is designed around the complementary seasonal demand of both states.

RUMSL will act as the 'Authorized Representative' for the bid process, facilitating the tender on behalf of both UPPCL and MPPMCL.

Tender Specs: Unit-Wise Bidding

Unit 1: 300 MW

Bidders bid for specific, pre-defined units.

Unit 2: 300 MW

Replaces "bucket filling" to account for varied unit locations.

Unit 3: 200 MW

Allows for more accurate pricing based on unit-specifics.

Unit 4: 200 MW

Total capacity auctioned in this tender: 1000 MW.

Tender Specs: Key Deviations

-  **Bid Quantum:** Minimum bid size is equal to a full unit (e.g., 200 MW). A single bidder can be allocated more than 50% of the total capacity.
-  **Eligibility:** Only for new projects built within the park. Bidders with existing 'untied capacity' are not eligible to participate.
-  **Capacity Utilization Factor (CUF):** Will be calculated on a 6-month basis for each procurer (UP & MP), not annually, to align with the complementarity model.
-  **Land Tenure:** At PPA expiry, the government land returns to RUMSL, who has the option to take over the plant or require decommissioning.

Key Enabler: Pre-Identified Land

- ✓ RUMSL (as Solar Power Park Developer) provides pre-identified land parcels for each unit.
- ✓ All land is located within the Morena Solar Park.
- ✓ This eliminates developer risk and potential delays from land acquisition hurdles.
- ✓ Ensures a significantly faster project implementation timeline.

Key Enabler: Grid Connectivity

- ✓ RUMSL is responsible for developing the internal power evacuation infrastructure.
- ✓ This includes securing all necessary approvals up to the ISTS delivery point.
- ✓ Provides a "plug-and-play" model for the selected Solar Power Developers (SPDs).
- ✓ Guarantees grid access and greatly simplifies the developer's scope of work.

Benefits for Developers

Land Acquisition Risk

Focus on Execution

A de-risked, bankable project. Developers can focus on execution, not on the procurement of land or evacuation right-of-way.

This model provides clear offtake terms with two major state utilities, backed by RUMSL's role as a facilitator.

Benefits for M.P. & U.P.

Meets Peak Demand

Aligns power procurement with each state's unique seasonal demand profile, ensuring energy security when it's needed most.

RPO Fulfillment

Significantly contributes to the Renewable Purchase Obligations (RPO) of both states with a large-scale, reliable project.

Accelerated Deployment

The "plug-and-play" park model de-risks the project, attracting competitive bids and ensuring faster project completion.

THANK YOU
